The information in this book is intended to offer helpful guidance on the diagnostic and treatment process conducted by a primary care provider, and is not a substitute for specific professional medical advice. Providers are encouraged to reproduce pages as desired from this booklet for use in their own clinical practice.

There was no pharmaceutical industry or commercial funding for preparing this booklet.
The Partnership Access Line (PAL) is a free consultation program for primary care providers (PCPs). It is funded by the Washington State Legislature and by the Washington Health Care Authority (HCA).

Any primary care doctor, nurse practitioner, or physician assistant throughout Washington State may call the PAL toll free number (866-599-7257) during business hours (Monday-Friday, 8am-5pm) for any type of child mental health advice for any child they see. The program fax number is 206-985-3266.

- A program assistant will ask for the provider’s name, contact information and basic patient information
- A child psychiatrist then will speak to the provider immediately or will schedule a convenient call back time (almost always on the same day). Providers can also speak directly with a social worker for resource questions.
- If the child psychiatrist and PCP determine over the phone that further consultation is needed on a client with Washington Medicaid or Healthy Options insurance, a rapid consult appointment will be offered with one of our child psychiatrists.

Peer Review

This guide is based on current evidence in the literature about mental health treatments in children. It is a digestion of current knowledge into focused points practical for the primary care physician. Future editions may cover additional topics in child health.

Although Dr. Robert Hilt is the primary author, this guide has utilized peer review from a variety of mental health experts and the helpful input and guidance from state agencies.

General peer review has included:
Child and Adolescent Outpatient Psychiatry Clinic, Seattle Children’s Hospital
U. of Washington Division of Public Health and Justice Policy
Eric Trupin, PhD, Professor of Psychiatry & Behavioral Sciences, U. of Washington
Bryan King, MD, Professor of Psychiatry & Behavioral Sciences, U. of Washington
Matt Speltz, PhD, Professor of Psychiatry & Behavioral Sciences, U. of Washington
John Dunne, MD, Child and Adolescent Psychiatrist

Section specific peer review has included:

*ADHD:*
Chris Varley, MD, Professor of Psychiatry & Behavioral Sciences, U. of Washington
Nicole Nguyen, PharmD, DSHS
Siri Childs, PharmD, Pharmacy Administrator, DSHS

*Anxiety:*
Teresa Piacentini, PhD, Clinical Psychologist, Seattle Children’s Hospital
Nicole Nguyen, PharmD, DSHS
Soraya Kanakis, PharmD, DSHS

*Autism:*
Bryan King, MD, Professor of Psych. & Beh. Sciences, U. of Washington

*Bipolar:*
Jack McClellan, MD, Associate Professor of Psych. & Beh. Sciences, U. of Washington
Kathleen Myers, MD, Associate Professor of Psych. & Beh. Sciences, U. of Washington
Nicole Nguyen, PharmD, DSHS
Soraya Kanakis, PharmD, DSHS

*Depression:*
Elizabeth McCauley, PhD, Professor of Psych. & Beh. Sciences, U. of Washington
Soraya Kanakis, PharmD, DSHS

*Eating Disorder:*
Rose Calderon, PhD, Associate Professor of Psych. & Beh. Sciences, U. of Washington
Cora Breuner, MD, Associate Professor of Pediatrics, U. of Washington

*Disruptive Behavior and Aggression:*
Terry Lee, MD, Acting Assistant Professor, U. of Washington
Methods

Dr. Hilt is the primary author of this guide, and peer reviewers have been utilized to verify the validity of the information, and help guide the content of the final product. Patient handout information chosen for inclusion in the guide was selected based on the clinical experiences of Dr. Hilt, the PAL Consultant team, and the section reviewers.

The process of formulating the care recommendations in the original Care Guide document started with a review of the most recent applicable practice guidelines from the American Academy of Child and Adolescent Psychiatry, and reviewing the applicable sections of *Bright Futures in Practice: Mental Health* practice guide from HRSA (which has received widespread endorsements including from the American Academy of Pediatrics). Regarding medications, Ovid Medline searches were performed looking back at least 10 years with limits set to include only child studies. These Medline searches were supplemented by reviewing recent conference presentations of drug treatment studies, and reviewing bibliographies of the published studies that were found. Bibliographies of review textbooks were also searched, including the bibliography of a textbook, *Pediatric Psychopharmacology Fast Facts* by DF Connor and BM Meltzer (2006).

For Care Principles Guide version 2.0 and newer, additional Medline topic searches for papers published over the previous year were performed to be certain the medication advice remained up to date. An additional section on Autism care was added, for which Dr. Alison Golombek was a co-author. Additional editing has been provided by Dr. Rebecca Barclay.

Psychosocial treatment guidance was formulated in consultation with the named section reviewers, the PAL Consultant team, and with members of the steering committee.

All recommendations in this guide were reviewed and modified by a panel of state experts in each of the applicable fields to reflect current and regionally endorsed care.
How This Care Guide Can Help You

As with all diagnostic processes, one has to think of the possibility of a mental health disorder before it is possible to diagnose it.

- Ask for the history of the child’s problem
- Ask about acute and chronic stressors relating to their problem
- Then ask yourself if there is a mental health diagnosis to consider
- Ask whether appropriate social, behavioral and family support is present

Certain clusters of symptoms bring up the possibility of particular diagnoses. For instance consider:

- **ADHD** if: inattentive or hyperactive with school difficulty
- **Anxiety disorder** if: unexplained somatic complaints, general or specific worries
- **Autism** if: developmental concern with the most severe impairment in social functioning
- **Bipolar** disorder if: episodic mood changes with manic features
- **Depression** if: withdrawn, irritable, unexplained somatic complaints
- **Eating disorder** if: losing weight or odd eating habits
- **Conduct or Oppositional Defiant Disorder (ODD)** if: oppositional or aggressive behavior

A primary care provider considering a particular mental health diagnosis can consult the corresponding section of this guide easily to find information and tools that they may need.

**Contained inside:**

- Tips on the general approach to mental health issues in primary care practices
- Recommended thought process for the evaluation and treatment of the above 7 common childhood disorders
- Free- to- reproduce rating scales for assistance with diagnosis and follow up
- Organized, current evidence based medication information
- Free- to- reproduce patient handouts (Spanish language versions available on the PAL website)
- Reference information that will be consistent with advice given out by PAL program psychiatrists

Medicaid Guide to Services

Public Mental Health Overview

HCA/Washington Medicaid contracts for mental health services via three avenues:
- Contracts with the Regional Support networks (RSNs)
- Contracts with Healthy Options Managed Care Organizations (MCO)
- Individual Core Provider Agreements with professionals who will accept payment on a fee-for-service basis for people who are eligible for Medicaid, but who are not enrolled with a Healthy Options MCO or eligible for care through the Regional Support Networks.

Regional Support Networks (RSN)
The RSNs subcontract with local community mental health clinics which provide the services. Assessments are available to all Medicaid covered individuals who request them, and emergency services are available 24/7. However, ongoing care is determined on the basis of severity, using the “Access to Care Standards”.

Summary of the RSN Access to Care Standards

An individual must meet all of the following before being considered for a level of care assignment with a RSN:
- The individual is determined to have a mental illness. The diagnosis must be included as a covered diagnosis in the list of Covered Childhood Disorders. That list, maintained on the DSHS website listed on the next page, contains most major disorders. The covered diagnosis list does not include Autism Spectrum Disorders.
- Some mental health diagnoses require some additional criteria documenting that there is a high level of impairment in order to qualify for services.
- The individual’s impairment(s) and corresponding need(s) must be the result of a mental illness.
- The intervention is deemed to be reasonably necessary to improve, stabilize or prevent deterioration of functioning resulting from the presence of a mental illness.
- The individual is expected to benefit from the intervention.
- The individual’s unmet need would not be more appropriately met by any other formal or informal system or support.
- Children under the age of six may not readily fit diagnostic criteria. For them eligibility is determined on the basis of functional impairment related to the symptoms of an emotional disorder.

Functional Criteria: Children’s Global Assessment Scale (C-GAS)
There must be demonstrated functional impairment including a C-GAS score of less than 60, and requiring assistance to meet the need in at least one life domain for Brief Services (up to 6 months, or low intensity for 12 months). For Community Support services (up to 12 months) there must be a C-GAS score of less than 50 and requiring assistance to meet the need in at least one life domain. C-GAS is generally not considered valid for children under the age of six; therefore these children are exempt from such scoring. A “DC:0-3” rating score may be substituted for that evaluation. Functional impairment for very young children is further described in the published Access to Care Standards.
Medicaid Guide to Services, cont.

Life domains for the Access to Care Standards include:
- Health & self-Care, including the ability to access medical, dental and mental health care to include access to psychiatric medications
- Cultural factors
- Home & family life safety & stability
- Work, school, daycare, pre-school or other daily activities
- Ability to use community resources to fulfill needs

Requesting Services from the RSN System

If your patient presents as having serious emotional disturbance, such that intensive mental health services are warranted for more than the 20 hours per year provided through Healthy Options or Fee-For-Service, you should refer the child to the local RSN for assessment.

Crisis mental health services are provided upon request, 24-hours a day, 7 days a week and are available to anyone who needs them regardless of ability to pay. All RSNs publish a toll free crisis number in local phone books and can be found online at: https://www.dshs.wa.gov/bhsia/division-behavioral-health-and-recovery/regional-support-networks-rsns-services-information

To refer someone for crisis intervention services, you or the family should call the appropriate crisis line listed on the following pages.

RSNs ensure an intake evaluation is made available within 10 business days of the request for routine mental health services (unless an intake evaluation has already been provided in the last 12 months) that establishes Medical necessity based upon the Access to Care Standards. This is true no matter how the request for services is made. To view a map of the RSN’s, go to: https://www.dshs.wa.gov/sites/default/files/BHSIA/dbh/documents/Regional%20Support%20Network%20MAP10_2012.pdf

Requests for RSN services may be made to an RSN or to an RSN contracted provider via:
- A telephone call
- An in person request for services by family
- A written request for services by family
- Through a written EPSDT referral (Early and Periodic Screening, Diagnosis and Treatment)

Unless the individual requests a later appointment date or the scheduled clinician is unexpectedly unavailable, the individual will be seen by their assigned provider within 28 days of their intake assessment.

For an updated list of currently contracted Healthy Options providers visit HCA online at: [www.hca.wa.gov/medicaid/healthyoptions/pages/planlinks.aspx](http://www.hca.wa.gov/medicaid/healthyoptions/pages/planlinks.aspx)

Not all Healthy Options plans serve all counties. To obtain more information about Healthy Options plans and providers, visit HCA online at [www.hca.wa.gov/medicaid/healthyoptions/pages/planlinks.aspx](http://www.hca.wa.gov/medicaid/healthyoptions/pages/planlinks.aspx).

Fee-For-Service

If your patient is not enrolled with a Healthy Options plan and is not likely to meet medical necessity (per the Access to Care Standards), you may contact Washington Medicaid by calling [800-562-3022 (TTY: 800-848-5429)](tel:8005623022) to find a mental health provider who will accept payment from Washington Medicaid to provide mental health services to your patient on a “fee-for-service” basis.
Additional Tools from HCA

12 Month Service History Reports
In order to provide a comprehensive medical history for you regarding your patients, HCA has developed a rolling 12-month client medical profile. It includes prescriptions, emergency room usage and other services. To obtain a profile:

- Fax patient’s signed release form to 360-725-1328 Attn: Kathy Cleeves. You may use your own release or the HCA release.
- Include on the request: Your return fax and phone numbers, including area code, and the client’s name and HCA identification number.

Requests are processed Monday through Friday, 8am to 5pm and will be sent to you within 24-48 hours. The client will also be sent a notification to their last known address.

To obtain a 12 month history of Rx, ER and other services, visit HCA online at: www.hca.wa.gov/medicaid/pharmacy/pages/toolkit.aspx

Patient Review and Coordination (PRC) Program
PRC (formerly PRR) helps to prevent patients from inappropriate use of services by limiting patients to the following for a period of at least 24 months:

- One primary care provider
- One narcotic prescriber
- One pharmacy
- One hospital for non-emergent services

To refer your patient for enrollment in the Patient Review and Coordination (PRC) program, call HCA at: (360) 725-1780 (Calls are returned within 24 hours) or visit HCA online at: www.hca.wa.gov/medicaid/prr/Pages/index.aspx

CHET (Child Health & Education Tracking) screening tools for foster care
The purpose of Child Health & Education Tracking is to identify the well-being, needs and strengths of children in out-of-home care and to review and monitor the outcomes of the services provided to meet the needs or to support the strengths of the child.

What this means practically is that for children placed in foster care (for whom a greater than 30 day out of home placement is anticipated), a series of health screening questionnaires are administered by Children’s Administration within that child’s first 30 days of placement. The actual instruments in the CHET include the CBCL and ASQ-SE would have been the two items of particular interest to someone looking into a child’s mental health needs.

The CHET rating scales are collected and maintained by Children’s Administration, and can be accessed by asking for any CHET results for the child from the child’s foster care case worker.
Adolescent Substance Abuse Treatment and Prevention

HRSA's Division of Behavioral Health and Recovery (DBHR) oversees the provision of substance abuse treatment for adolescents in Washington State.

To learn more about DBHR, visit: www.dshs.wa.gov/DBHR/

Drug and Alcohol Treatment for Adolescents

Adolescents who need alcohol/drug treatment should be referred to the Teen Line 1-877-345-TEEN to arrange for an assessment, to locate a treatment agency, and to verify that they are eligible for state-funded services.

Adolescent Chemical Dependency Treatment 24-Hour Referral: 1-877-345-TEEN or 206-722-4222

Reduce Underage Drinking

Find resources parents can use to prevent underage drinking at Start Talking Now, the Washington State Coalition to Reduce Underage Drinking (RUaD Coalition) website. That web address is: www.starttalkingnow.org/
The Washington State Health Care Authority (HCA) is interested in the safe and effective use of medications in all children up to age 18. Specific areas of focus for the review service include the use of medication in children between the ages of 0-4 and appropriate dosing limits in the prescribing of these medications. This program is overall meant to assure prescriptions covered by HCA are within the safety review guidelines established in collaboration with the HCA Pediatric Advisory Group and the Drug Utilization Review Board.

Fact Sheet: Antipsychotics
Drug Utilization Review Program

The following dosing guidelines regarding child antipsychotic medications were established by the Washington State Health Care Authority (HCA) Pediatric Advisory Group and Drug Utilization Review Board. Prescriptions outside of these dosing limits will require a safety/appropriate use review with a member of HCA's second opinion network.

Child in crisis: Families can receive an urgent medication fill of an antipsychotic prescription that will trigger a review per the below guidelines if they indicate at the pharmacy that their child is in crisis, or if the provider writes “child in crisis” on the prescription.

*Prescriptions exceeding dosing limitations for age require a HCA-approved second opinion

Antipsychotics for Children in Foster Care

A state law (SHB 1879) taking effect 7/24/15 requires that a psychiatric expert provide a second opinion review of any use of an antipsychotic prescribed for more than 30 days to any child in foster care.

Psychiatric Polypharmacy

Other criteria under which HCA will initiate a required second opinion review of child psychiatric medications (as advised by the HCA Pediatric Advisory Group and Drug Utilization Review Board) include:

- Two (2) or more antipsychotic medications prescribed concomitantly after 60 days
- Five (5) or more different psychotropic medications prescribed concomitantly after 60 days
Fact Sheet: Alpha Agonist Reviews

The following dosing guidelines regarding alpha-2 agonist medications were established by the Washington State Health Care Authority (HCA) Pediatric Advisory Group and Drug Utilization Review Board. Prescriptions outside of these dosing limits will require a safety/appropriate use review with a member of HCA’s second opinion network.

<table>

</tbody>
</table>

If clonidine and guanfacine are prescribed together for the same patient, a cumulative alpha agonist dose will be calculated and a review will be required if that cumulative dose exceeds the individual class threshold. For this calculation, guanfacine 1mg is considered pharmacologically equivalent to clonidine 0.1mg.

Generics First for New Starts of Psychiatric Medications

HCA will cover only preferred generic drugs as a client’s first course of therapy within the following drug classes:

- Atypical Antipsychotics (for ages 17 and younger only)
- Attention Deficit Hyperactivity Disorder (ADHD) Drugs

Only clients who are new to the above drug classes will be required to start on a preferred generic product over a brand name product. Prescriptions filled for any one of the above drug classes within the preceding 180 days establishes that the patient is not new to the drug class. HCA is not requiring clients who are established and doing well on a drug to be changed to a generic product. See HCA Memo 09-61 found at [www.hca.wa.gov/medicaid/billing/documents/memos/2009/09-61.pdf](http://www.hca.wa.gov/medicaid/billing/documents/memos/2009/09-61.pdf) for more details.

To receive regular updates on the Washington HCA Medication review program, Prescribers may sign up for the state information list serve at: [https://fortress.wa.gov/dshs/hrsalistsrvsignup/](https://fortress.wa.gov/dshs/hrsalistsrvsignup/). Select “pharmacy” to have these notices sent to your email.
Mental Health Assessment Principles

- **You do not have to complete an assessment in one visit.** Listen to the general problem, establish that the situation is safe to wait another week or so, and then schedule a second visit to finish your assessment. Mental health specialists often take more than one visit to decide on diagnoses.

- **Establish what pushed the situation into your office, “Why are you here today?”** A chronic stressor (like sadness about parents separating) does not usually trigger an office visit: acute stressors do (like a major child outburst after one parent cancels their upcoming weekend plans with the child).

- **Strongly consider use of a general screening instrument** during health maintenance visits, like the PSC-17, to see if mental health problems are worth investigating further.

- **Seek to interview the child alone,** especially if an internalizing problem like depression or anxiety is suspected, to obtain a more thorough history.

- **Empathic engagement with the child is worth the effort.** Young children open up better after inquiring about low risk topics like their name, birthday, or school. Adolescents open up better after showing genuine interest in them, such as asking about their interests, hobbies. If a patient looks like they don’t want to be there, comment on this and show them you are able to connect with how they feel.

- **Collateral information is invaluable.** Parents often differ from each other in their view of their child, and schools often have other information vital to your assessment. Ensure that past medication history and treatments are available to you.

- **If suspecting a particular disorder, give that specific rating scale to parent/child.** You could leave the room to see another patient, then return and review rating scale results. Rating scales can help confirm diagnoses, and they provide an objective measure for following treatment responses.

- **Recognize that child disorders have a developmental trajectory.** For instance early oppositionality may evolve into depression or anxiety, and early depression may evolve into bipolar disorder.

- **Pay close attention to what you see.** The mental status exam of a child involves watching how they position themselves, process information and interact. For instance a child complaining of body aches who appears withdrawn, speaks softly, and will not look you in the eye should be screened for depression.

- **Put it all together into your best clinical judgment, and then revise your diagnosis over time.** It is very difficult to get it exactly right on the first visit. Mental health specialists often revise their diagnoses over time as more information becomes available. Also with children the process of development can make it hard to be definite about a diagnosis. You are ahead of the game if you can recognize with certainty the general category of problem, such as some type of learning disability or some type of anxiety disorder. Remember Occam’s Razor: a single diagnosis plus a full social/family picture may explain things better than multiple mental health diagnoses.

- **Remember you can ask for help.** Contained in this care guide are numerous State and County programs, like the Partnership Access Line, that are designed to assist you and your patient. For severe behavioral problems always consider referral to a mental health provider to obtain a care assessment.
What Can You Do For Multiple Problems?

- **Establish what seems to be the leading problem and focus your attention on that.** For instance if a child is having screaming tantrums, hitting other children, is sleeping poorly and sometimes appears anxious, one may decide the leading problem is unsafe externalizing behavior. In that case, review the steps of our disruptive behavior and aggression decision tree. The child’s sleep problems and intermittent anxiety can be explored further at a future appointment.

- **Get collateral information.** Particularly if the caregiver does not know the child's full history, other information sources including school, former physicians or therapists, other relatives, and foster care case managers will likely be able to give you information that clarifies what should be done. Respect the fact that it takes time to gather this additional information, which can be done by phone calls, record requests, or by sending out questionnaires or rating scales. Remember our first assessment principle; you don’t have to figure this all out in one visit.

- **Use checklists for preliminary behavior/mental health screening.** These will help you narrow down what area to investigate and can quantify the likelihood of finding different types of diagnoses. Options include:
  - PSC-17 (free, included in this guide)
  - SDQ (Strength and Difficulties Questionnaire, 25 questions, 5 subscales, good psychometrics, multiple languages available, free for individual providers to download and use, free online scoring.) You must go to the developer's website to obtain: [www.sdqinfo.org](http://www.sdqinfo.org)
  - CBCL (Child Behavior Checklist, school age version has 113 core questions plus 2 other pages to describe child functioning, widely used, very good psychometrics, translated versions available.) Requires scoring software and requires purchase from the developer: [www.aseba.org](http://www.aseba.org)

- **Discuss the scenario with a specialist.** PAL psychiatrists would like to talk about any tricky situations with you, and are available Monday through Friday, 8am to 5pm.

- **If you suspect a specific problem, a disorder specific rating scale can help you learn how likely or severe that diagnosis might be.** Disorder specific scales like the Vanderbilt scale for ADHD will not make the diagnosis for you—a diagnosis must be based on your overall clinical impression. When children have severe mental health symptoms, referral to a mental health clinic is appropriate. Very high rating scale scores might similarly indicate that referral to specialty care is appropriate.

- **A good therapist can help you refine your diagnosis over time.** If you identify the child has a general problem for which a therapist referral is appropriate (such as having some sort of mood disorder), then the therapist can provide further specialized assessment (such as diagnosing Major Depression).

- **If you choose to prescribe a medication when the diagnosis is still uncertain, be very clear what the target symptom is you are treating, and monitor that symptom closely.** If that target symptom does not improve, then that medicine needs to be stopped. It is very important to not simply stack medicines one upon another without demonstrating a clear benefit to the child.

Developmental Screenings
Developmental Screening Tools and Rating Scales

The following is just a small number of the validated developmental screening tools available. They may be accessed at the website links provided. The ECSA is included in its entirety on the next page, which is free to reproduce for clinical care.

Validated scales with a per-use fee:

1. **Ages and Stages Questionnaire (ASQ-3)** — It takes 1-15 minutes for caregivers to complete; scoring takes 2-3 minutes. Child age range: 1 month to 5.5 years of age. Sensitivity 86%; specificity 85%. The ASQ addresses five developmental areas (communication, gross motor, fine motor, problem solving, and personal-social). [http://agesandstages.com/products-services/asq3/](http://agesandstages.com/products-services/asq3/)

2. **ASQ:SE-2**—It takes 10-15 minutes for parents or caregivers to complete; scoring takes 2-3 minutes. Age range is 1 month through 6 years old. The Questionnaire assesses seven social-emotional areas (self-regulation, compliance, communication, adaptive behaviors, autonomy, affect, and interaction with people). [http://agesandstages.com/products-services/asqse-2/](http://agesandstages.com/products-services/asqse-2/)

3. **Parents’ Evaluation of Developmental Status (PEDS)** — Time to administer and score is about two minutes. Child age range: birth to 8 years. Sensitivity 74-80%; specificity 70-80%. The tool elicits parents concerns about children’s language, motor, self-help, early academic skills, behavior and social-emotional/mental health. [http://www.pedstest.com](http://www.pedstest.com)

Validated scales that are free to use:

1. **Modified Checklist for Autism in Toddlers—Revised (MCHAT-R)**—The MCHAT takes parents 5 minutes to complete. The MCHAT is valid for children ages 16-30 months old. Sensitivity 91%; Specificity 95%. [http://www.mchatscreen.com/](http://www.mchatscreen.com/)

2. **Childhood Autism Spectrum Test (CAST)**—This parental questionnaire is available through the ARC for use in research to screen for autism spectrum conditions. The target age range is 4-11 years old. Sensitivity 100%; specificity 97%. [http://www.autismresearchcentre.com/arc_tests](http://www.autismresearchcentre.com/arc_tests)

3. **Early Childhood Screening Assessment (ECSA)**—The ECSA is a screening assessment for emotional and behavioral development as well as caregiver distress. The age range it covers is 1.5 to 5 years old. ECSA scores are associated to scores on longer, established measures including the Child Behavior Checklist. The sensitivity is 85% and the specificity is 83%.

   **Scoring the ECSA:** The child score is the sum of all circled numbers of items 1-36, with a maximum score of 72. A score of greater than or equal to 18 means the child needs further socioemotional assessment. Slightly more than 3/4 of children with this score will meet criteria for an impairing mental health problem. The ECSA is not valid if more than two child items are skipped.

   A parent depression score greater or equal to three suggests a higher rate of depression and should be followed up clinically. Items 38, 39, and 40 reflect caregiver distress.

   Thanks to Mary Margaret Gleason, MD for offering permission to incorporate the ECSA in the PAL Care Guide.
Early Childhood Screening Assessment (ECSA)  Child name:___________________ Date ______

- Please circle the number that best describes your child compared to other children the same age.
- For each item, please circle the + if you are concerned and would like help with the item.

Are you concerned about your child’s emotional or behavioral development?  Yes  Somewhat  No
Pediatric Symptom Checklist PSC-17 Description

The PSC-17 is a general mental health screening tool designed to be simple to use in primary care practices, based a longer form instrument known as the PSC-35. It can help primary care providers assess the likelihood of finding any mental health disorder in their patient. The brief and easy to score PSC-17 has fairly good mental health screening characteristics, even when compared with much longer instruments like the CBCL (Child Behavior Checklist by T. Achenbach).

A 2007 study in primary care offices compared use of the PSC-17 to simultaneous use of the CBCL in 269 children aged 8-15, showing reasonably good performance of its three subscales compared to similar subscales on the CBCL. The gold standard here was a K-SADS diagnosis, which is a standardized psychiatric interview diagnosis. These comparison statistics are summarized below, with positive and negative predictive values shown based on different presumed prevalence (5 or 15%) of the disorders. Providers should notice that despite its good performance relative to longer such measures, it is not a foolproof diagnostic aide. For instance the sensitivity for this scale only ranges from 31% to 73% depending on the disorder in this study:

W Gardner, A Lucas, DJ Kolko, JV Campo “Comparison of the PSC-17 and Alternative Mental Health Screens in an At-Risk Primary Care Sample” JAACAP 46:5, May 2007, 611-618

**PSC-17 Scoring:**

- PSC-17 Internalizing score positive if ≥ 5
- PSC-17 Externalizing score positive if ≥ 7
- PSC-17 Attention score positive if ≥ 7
- PSC-17 Total score positive if ≥ 15

“Attention” diagnoses can include: ADHD, ADD
“Internalizing” diagnoses can include: Any anxiety or mood disorder
“Externalizing” diagnoses can include: Conduct disorder, Oppositional Defiant Disorder, adjustment disorder with disturbed conduct or mixed disturbed mood and conduct

(scoring totals)

**Scoring:**
- Fill in unshaded box on right with: “Never” = 0, “Sometimes” = 1, “Often” = 2
- Sum the columns.
PSC-17 Internalizing score is sum of column I
PSC-17 Attention score is sum of column A
PSC-17 Externalizing score is sum of column E
PSC-17 Total Score is sum of I, A, and E columns

**Suggested Screen Cutoff:**
PSC-17 - I ≥ 5
PSC-17 - A ≥ 7
PSC-17 - E ≥7
Total Score ≥ 15

Higher Scores can indicate an increased likelihood of a behavioral health disorder being present.

PSC-17 may be freely reproduced.

Created by W Gardner and K Kelleher (1999), and based on PSC by M Jellinek et al. (1988)

Evidence Based Mental Health Care

Throughout this guide, the treatment options listed are based on both the best available research evidence, and expert opinions from Seattle Children’s Hospital Department of Psychiatry and the UW Division of Public Behavioral Health and Justice Policy.

Evidence based care is a relative concept, not an absolute one. Evidence for treatment varies in its reliability: randomized controlled trials carry a different evidence weighting than individual provider experiences. As more information emerges, what is considered the most evidence based treatment is expected to evolve. Evidence based medication treatment advice is spread throughout this guide, in tables and care flow diagrams for each included disorder. Psychosocial treatment guidance is also listed briefly within each care flow diagram.

A common theme typically emerges in both clinical experience and in the results of formal research trials: that a combination of medical treatment and social/behavioral care often ensures the best of outcomes.

The importance of engaging both a child and family in treatment can not be underestimated. An “evidence based treatment” will not work if families cannot make it to appointments, or if the treatment does not meet the child’s or family’s own goals. Engagement can be enhanced through educating your families about what to expect. “Wraparound” programs, where available, have a philosophy emphasizing engagement and shared setting of treatment goals, and can be a further asset in this regard.

Families can find additional support from organizations like NAMI, the National Alliance on Mental Illness (www.nami.org), SAMHSA the Substance Abuse and Mental Health Service Administration (www.samhsa.gov), and the National Institute of Mental Health (www.nimh.nih.gov)
ADHD
Considering ADHD diagnosis?
Problem from inattention/hyperactivity?

Consider comorbidity or other diagnosis:
- Oppositional Defiant Disorder
- Conduct Disorder
- Substance Abuse
- Language or Learning Disability
- Anxiety Disorder
- Mood Disorder
- Autistic Spectrum Disorder
- Low Cognitive Ability/Mental Retardation

Diagnosis:
Preschoolers have some normal hyperactivity/impulsivity: recommend skepticism if diagnosing ADHD in this group. (Note that Medicaid may require a medication review if prescribing and child age <5)
If rapid onset symptoms, note this is not typical of ADHD

Use DSM-5 criteria:
- Must have symptoms present in more than one setting
- Symptom rating scale strongly recommended from both home and school
  - Vanderbilt ADHD Scale (many others available, for a fee)
- If unremarkable medical history, neuro image and lab tests are not indicated
- If significant concern for cognitive impairment, get neuropsychological/learning disability testing

Treatment: If diagnose ADHD

Mild impairment, or no medication trial per family preference
- Psychosocial Treatment:
  - Behavior therapy
  - Behavior management training (essentially more effective time outs and rewarding positive behaviors)
  - Social skills training
  - Classroom support/communication
  - Give parent our resource list to explain the above treatments (the parent handout in this guide)

Significant impairment, or psychosocial treatments not helping
- Treat substance abuse, consider atomoxetine or alpha2 agonist trial
- Active substance abuse?
  - YES
  - Monotherapy with methylphenidate or amphetamine preparation.
  - Titrate up every week until maximum benefit (follow-up rating scales help)
  - If problem side effects or not improving, switch to the other stimulant class
  - If problem side effects, or not improving, switch to atomoxetine or alpha2 agonist monotherapy
  - If no improvement, reconsider diagnosis. Medication combinations like alpha-2 agonist plus stimulant may be reasonable at this stage.

Vanderbilt ADHD Teacher Rating Scale (page 1 of 2)

Child’s Name ___________________ Date of Birth _________ Grade ___ Today’s Date ________________
Completed by ___________________ Subject Taught (if applicable) _________________________

Each rating should be considered in the context of what is appropriate for the age of the child.
If you have completed a previous assessment, your rating should reflect the child’s behavior since you last completed a form.

**For Office Use Only**

Vanderbilt ADHD Diagnostic Parent Rating Scale was developed by Mark L. Wolraich, MD. Reproduced and format adapted by R. Hilt, MD and PAL with permission.
Scoring the Vanderbilt ADHD Scales

The Vanderbilt rating scale is a screening and information gathering tool which can assist with making an ADHD diagnosis and with monitoring treatment effects over time. The Vanderbilt rating scale results alone do not make a diagnosis of ADHD or diagnose any other disorder—one must consider information from multiple sources to make a clinical diagnosis. Symptom items 1-47 are noted to be significantly present if the parent or teacher records the symptom as “often or very often” present (a 2 or 3 on the scale). The “performance” items at the end are felt to be significant if the parent or teacher records either a 1 or 2 on each item.

**Parent Version**

**Predominantly Inattentive Subtype**
Requires 6 or more counted behaviors on items 1 through 9 and a performance problem (score of 1 or 2) in any of the items on the performance section.

**Predominantly Hyperactive/Impulsive Subtype**
Requires 6 or more counted behaviors on items 10 through 18 and a performance problem (score of 1 or 2) in any of the items on the performance section.

**Combined Subtype**
Requires 6 or more counted behaviors each on both the inattention and hyperactivity/impulsivity dimensions.

**Oppositional-defiant disorder**
Requires 4 or more counted behaviors on items 19 through 26.

**Conduct disorder**
Requires 3 or more counted behaviors on items 27 through 40.

**Anxiety or depression**
Requires 3 or more counted behaviors on items 41 through 47.

**Teacher Version**

**Predominantly Inattentive Subtype**
Requires 6 or more counted behaviors on items 1 through 9 and a performance problem (score of 1 or 2) in any of the items on the performance section.

**Predominantly Hyperactive/Impulsive Subtype**
Requires 6 or more counted behaviors on items 10 through 18 and a performance problem (score of 1 or 2) in any of the items on the performance section.

**Combined subtype**
Requires 6 or more counted behaviors each on both the inattention and hyperactivity/impulsivity dimensions.

**Oppositional defiant and conduct disorders**
Requires 3 or more counted behaviors from questions 19 through 28.

**Anxiety or depression**
Requires 3 or more counted behaviors from questions 29 through 35.

The performance section is scored as indicating some impairment if a child scores 1 or 2 on at least 1 item.

Information for Families

Books families may find helpful:

Raising Resilient Children: Fostering Strength, Hope and Optimism in Your Child (2002), by Robert Brooks, PhD and Sam Goldstein, PhD

Attention Deficit Disorder: The Unfocused Mind in Children and Adults (2006), by Tom Brown, PhD

Books children may find helpful:

Learning to Slow Down & Pay Attention: A Book for Kids about ADHD (2004), by Kathleen Nadeau, PhD, Ellen Dixon, PhD, and Charles Beyl

Websites families may find helpful:

Parents Med Guide
www.parentsmedguide.org (quality information about medications for ADHD)

Children and Adults with ADHD
www.chadd.org (support groups, information resource)

Teach ADHD
www.teachadhd.ca (teaching advice for ADHD kids)

National Resource Center on ADHD
www.help4adhd.org

“Behavior Management Training” and “Behavior Therapy”:
Manual and research based therapies for ADHD related problems lasting 10-20 sessions that can be performed by a qualified therapist. These treatments, though helpful with ADHD, are usually less effective than medications. The principle elements of these treatments are:

- reviewing information about the nature of ADHD
- learning to attend carefully to both misbehavior and when child complies
- establishing a “token economy,” like sticker chart rewards
- using time out effectively
- managing non-compliant behavior in public settings
- using a daily school report card

This resource page is now available in Spanish at www.palforkids.org
Anxiety
Anxiety Problem?
Unexplained somatic complaints?

Safety check: Neglect/Abuse?
Drug abuse?
Medical cause? (i.e. medication effects, asthma)

Think about comorbidity: Depression and ADHD are common. ~50% of kids with anxiety have 2 or more anxiety diagnoses

Diagnosis:
DSM-5 diagnostic criteria
SCARED anxiety scale or the Spence Anxiety Scale for Children (www.scaswebsite.com for the Spence, is free, has translations)
If obsessions/compulsions, think of OCD
If nightmares/flashbacks or trauma, think of PTSD
Label as “Anxiety Disorder, NOS” if the type is unclear

Can problem be managed in primary care?

YES

Mild Problem
(noticeable, but basically functioning OK)

Discuss their concerns
Reassure that “many kids feel this way”
Correct distorted thoughts (e.g. “If I don’t get an ‘A’, I’ll die”)
Reduce stressors, but still have to face a fear to conquer it
Offer tip sheet on relaxation techniques to help child tolerate exposure to their fears
If parent is highly anxious too, encourage them to seek aide as well since anxiety can be modeled
Offer parent and child further reading resources on anxiety
Explain somatic symptoms as “stress pains” or something similar

Come back if not better

Moderate/Severe Problem
(significant impairment in one setting or moderate impairment in multiple settings)

Recommend Individual psychotherapy
(CBT is preferred; key element is a gradual exposure to fears)
Also offer the advice on the left pathway as per a “mild problem”

Consider starting SSRI if therapy not helping or anxiety is severe
Low dose Fluoxetine or Sertraline are the first line choices
Use therapy alone before medications unless anxiety is quite impairing
Wait four weeks between SSRI increases, use full dose range if no SE
Check for agitation/suicidal thought side effect by phone or in person in 1-2 weeks, and stop medicine if agitation or increased anxiety
Try a second SSRI if first is not helpful

Referral

NO

Relaxation Therapy Tip Sheet

The following two techniques when practiced regularly can become useful skills that help a child face a plan of gradually increasing exposure to their fears. Gradual, tolerated exposures are a core element of “unlearning” a fear. It is suggested to do either or both of these once a day for a while until the calm state produced can be easily achieved. Using one of these behaviors will decrease physiological arousal if the body feels anxious, stressed or in pain. It is best to practice these skills at times when not feeling anxious so that it will be less intimidating to try at a time of high anxiety.

Breathing Control
- Imagine that you have a tube that connects the back of your mouth to your stomach. A big balloon is connected to the tube down in your stomach. When you breathe in the balloon blows up and when you breathe out the balloon deflates. Put your hand on your stomach and practice taking breaths that push your hand out as that balloon inflates. When learning this trick, it might be easier to lie down on your back while you observe what is happening.
- Now focus on doing these stomach balloon breaths as slowly and as comfortably possible. Inhale slowly, pause briefly, and then gently exhale. When you allow that balloon to deflate, notice the calm feeling that comes over you. Counting the length of each phase may help you find that sense of calm, such as counting slowly to 3 during inhalation, to 2 while pausing, then to 6 while exhaling.
- Now practice making your breath smooth, like a wave that inflates and deflates.
- If you experience brief dizziness or tingling in fingers, this just means you are breathing too quickly (hyperventilating), so slow your breathing further to stop that sensation. Once skilled at this, just a few controlled breaths at a time of stress will produce noticeable relief, and can be done anywhere.

Progressive Muscle Relaxation
This is particularly helpful for kids who experience body aches along with stress/anxiety. It is easier to have someone guide a child through this the first few times until the technique is learned. Tell kids this is like learning to turn their muscles from uncooked spaghetti into cooked spaghetti.

- Lie down in a quiet room and take slow breaths, try Breathing Control as above.
- Think about the muscles of your head and face, now scrunch them up tightly and clench your teeth, hold that as you count to 10, then allow all of those muscles to relax. Notice that feeling of relaxation in your face, and your jaw loosening.
- Now concentrate on muscles of your shoulders and neck, tighten up your neck muscles pulling your head down, shrug your shoulders up, hold that uncomfortable tightness, for a count of 10, then let all those muscles relax and notice the feeling.
- While continuing your slow breathing, move your attention to your arms and hands, tightening those muscles further and further, hold it as you count to 10. Then allow those muscles to relax.
- Now think about the muscles in your legs, your bottom and your feet, tighten all these muscles up, feel the hard tension throughout your legs, hold it as you count to 10, then allow your legs and feet to relax as you continue your slow breathing.
- Now that all of your muscles have relaxed, continue your slow breathing and take some time to enjoy the sense of relaxation. Focus on how the most relaxed areas of your body feel now.

Robert Hilt, MD

This resource page is now available in Spanish at www.palforkids.org
Identifying Post-Traumatic Stress Disorder (PTSD)

- Inquire directly about trauma, which could include child abuse, domestic violence, community violence, or serious accidents. Avoid asking the child for specific details of trauma during a brief office visit as this can be very distressing for the child, unless this is necessary to ensure their current safety.
  - Consider asking for trauma details from the caregiver instead.
  - Or ask the child a general question like, “What’s the worst thing that ever happened to you?” so that the child can be in control of their response.
  - Or ask the child about current symptoms of PTSD (outlined below) rather than asking for trauma details.
- If a traumatic experience has occurred, screen for PTSD symptoms: “Sometimes when a child (or even an adult) experiences a frightening event, they can continue to be bothered by it and it can affect them in different ways…”
  - Look for symptoms such as: (1) intrusion (dreams/nightmares, flashbacks or psychological/physiological distress at trauma cues), (2) avoidance (of trauma reminders such as people/places or of distressing memories, thoughts, or feelings), (3) changes to cognition or mood (affecting beliefs about oneself or the world, willingness to engage in activities, or resulting in a negative emotional state), or (4) alterations in arousal (irritable outbursts, reckless behavior, hypervigilance, exaggerated startle, poor sleep, or concentration problems).
  - In children 6 years and younger, symptoms may emerge through play and the DSM-5 lists separate PTSD diagnostic criteria.
  - Symptoms causing distress or impairment for a period of more than 1 month suggest PTSD (versus an acute trauma reaction).
- When addressing trauma reactivity, the number one treatment tenet is: ensure the child is safe. Children cannot recover from a trauma if the trauma is on-going or at risk of occurring again.
  - When parents are also affected by a trauma, their child’s recovery can be delayed. Parents need to have their own mental health needs addressed as well to become an effective support for their child.

Treatment

Psychotherapy or counseling is the first-line treatment

- Refer to a licensed mental health professional.
- Trauma-focused therapy is preferred over non-specific therapy.
- Refer for Trauma-Focused Cognitive Behavioral Therapy (TF-CBT) when possible for ages 3-17 years old.
- Younger children may benefit from joint child-parent therapy.

Medications

- There is no “PTSD medication” with compelling evidence for use in children.
- In some cases, medication can be considered for acute symptom reduction, treatment of a comorbid disorder, or if therapy response has been unsatisfactory.
- If other diagnoses are present, such as depression or anxiety, consider medications for those diagnoses. Sertraline is approved for adult PTSD. If ADHD is comorbid, guanfacine could be considered for hyper-reactivity.
- Sometimes medications such as clonidine and prazosin can be considered at bedtime if nightmares have not improved with other treatments.

### SCORING

A total score of $\geq 25$ may indicate the presence of an **Anxiety Disorder**. Scores higher than 30 are more specific.

A score of 7 for items 1, 6, 9, 12, 15, 18, 19, 22, 24, 27, 30, 34, 38 may indicate **Panic Disorder** or **Significant Somatic Symptoms**.

A score of 9 for items 5, 7, 14, 21, 23, 28, 33, 35, 37 may indicate **Generalized Anxiety Disorder**.

A score of 5 for items 4, 8, 13, 16, 20, 25, 29, 31 may indicate **Separation Anxiety Disorder**.

A score of 8 for items 3, 10, 26, 32, 39, 40, 41 may indicate **Social Anxiety Disorder**.

A score of 3 for items 2, 11, 17, 36 may indicate Significant **School Avoidance**.

* Recommend decrease maximum dosage by at least 1/3 for pre-pubertal children
** Recommend using the lower dose increase increments for younger children.

Successful medication trials should continue for 6-12 months

Autism Spectrum Disorders

This section was co-authored by Robert Hilt, MD and A.A. Golombek, MD
**Considering an Autism Spectrum Disorder?**

**Any Early Red Flags?**
- Not smiling in response to being smiled at, or making eye contact
- Does not develop shared attention with others
- Does not respond to own name by 1 year of age
- Poor social communication or lack of interest in other children

**Consider a comorbidity or other diagnoses:**
- Intellectual Disability (ID), Global Developmental Delay (GDD), Learning Disorders
- Speech and Language Disorders
- Hearing or Vision Impairment
- Neglect or Abuse
- Other Neurologic Disorders (epileptic, infectious, auto-immune, neoplastic, metabolic)
- Other Psychiatric Disorders (Anxiety, Depression, ADHD)

**Diagnosis:** Use DSM-5 diagnostic criteria which include presence or early developmental history of:

1. Impairments in Social Communication and Social Interaction—three domains of impairment in this area should include A) deficits in social-emotional reciprocity, B) deficits in nonverbal communication for social interaction, and C) deficits in developing, maintaining, and understanding relationships.

2. Restrictive, repetitive, patterns of behavior, interests or activities—including at least two of the following domains of A) stereotyped/repetitive movements, use of objects or speech, B) insistence on sameness, inflexible routines, ritualized patterns of behavior, C) highly restricted, fixated interests of abnormal intensity or focus, D) hyper or hypo-reactivity to sensory input or unusual interest in sensory aspects of the environment

May augment one’s assessment with an age-appropriate screening tool:
- M-CHAT (Modified Checklist of Autism in Toddlers) for age 16-30 months.
  Found at [www2.gsu.edu/~psydlr/Diana_L_Robins_Ph.D..html](http://www2.gsu.edu/~psydlr/Diana_L_Robins_Ph.D..html)
- CAST (Childhood Autism Spectrum Test) for age 4-11 years, and AQ (Autism Quotient) for age 12-15 years.
  Found at [www.autismresearchcentre.com/arc_tests](http://www.autismresearchcentre.com/arc_tests)

**Treatment:**
- Refer to further evaluation, Early Intervention and education:
  If birth to 3 years old, contact the Family Health Hotline (800-322-2588) or the Washington State Early Learning Program at ([www.del.wa.gov/development/esis/Default.aspx](http://www.del.wa.gov/development/esis/Default.aspx)). They assist with evaluation and treatment of any developmental concerns.
  If 3 years or older, contact the special education department in the local school system, and request an evaluation for an IEP. May ask for evaluation of intellect, academic progress, social and communication skills including pragmatic or social language, and occupational and adaptive function as all are relevant to the school setting.

- Individually evaluate/address any deficits in the following areas (might consider a formal autism evaluation):
  - Speech and language deficits: consider referral to speech/language therapist
  - Social skills deficits: consider social skills groups or a speech/language therapist
  - Sensory sensitivities/motor abnormalities that impact function: consider referral to occupational or physical therapy
  - Maladaptive behavior that affects function: consider referral to a behavioral therapist, psychologist, or psychiatrist

**Medical Evaluation:**
2. Consider epilepsy if comorbid intellectual or global developmental delay, or decline in functioning.
3. Do genetic, metabolic, or other studies as indicated by presentation. Consider Fragile X testing.
4. Monitor closely for treatable medical problems like ear infections and constipation which can worsen symptoms.
5. Consider co-morbid psychiatric conditions (like ADHD, anxiety or depression) which can worsen functioning.

**Primary References:**
Treatments for Autism and Difficulties Associated with Autism

Treatment for Autism:
- Currently, there is no single treatment for autism, but a variety of approaches may fit the child's unique circumstances.

Speech and Language Therapy:
- Consider when communication is a key concern. Goal is to teach pragmatic or social language skills, rewarding any steps child makes in this direction. Alternative communication systems like Picture Exchange Communication System (PECS) may be needed if child remains non-verbal. The picture exchange system lets the child and others point to pictures representing things (like food) or activities (like using the bathroom) to communicate. Achieving a means of basic communication is often essential in improving function and reducing maladaptive behaviors.
- Speech/Language therapists are commonly available in most communities and/or schools.

Social Skills Training:
- Consider when this is appropriate to the child’s developmental level. Social skills training often uses social stories, role-playing, and peer skills groups. Social stories are cartoon-like illustrations depicting social events (e.g., greeting new people, going to the store) or skills (e.g., asking for help when teased or distressed) to help children anticipate new events or practice skills. Social skills training may become a primary focus of the school environment to teach steps of how to interact with others, especially after basic communication skills are learned.
- May be available in communities and schools through the work of Speech and Language or other therapists.

Occupational and Physical Therapy:
- Consider when there are functional problems with adaptive skills or with muscle control. Occupational therapists (OTs) are often effective in improving function impaired by sensory sensitivities by modifying the environment. OTs may also assess and work on improving adaptive skills or skills of daily living. Physical therapists (PTs) can be helpful if the child has muscle control abnormalities which impair function.
- OT and PT providers are commonly available in communities

Medical Assessment:
- Consider medical, neurological, psychiatric, medication-induced, and trauma-related causes of maladaptive behaviors, especially if there are sudden changes in function. Rule out pain (head or ear aches, constipation) as a trigger for any new behaviors, particularly since children with autism are not typically very good at communicating distress and may exhibit maladaptive behavior when medically distressed.

Behavior Therapy:
- Consider addressing core deficits associated with autism and to reduce maladaptive behaviors. Intensive behavioral therapy and related training methods (which are the components of Applied Behavior Analysis or “ABA”) have been shown to improve many autism symptoms by teaching and reinforcing social and communication skills and by reducing maladaptive behaviors. Any behavioral program should be tailored to a child's needs, build on the child's interests, offer a predictable schedule, teach tasks as a series of simple steps, actively engage the child's attention in structured activities, and provide regular reinforcement of behavior. Efficacy of interventions should be tracked by establishing a baseline and monitoring progress, with interventions adjusted accordingly. Parental involvement is a major factor in treatment success—parents help identify target skills and behaviors, and are often trained to continue the therapy at home.
- Maladaptive behaviors can be reduced via a functional analysis of behavior, which includes characterizing the behavior, the setting, provoking, and reinforcing factors. The behavior is then modified by changing these factors. See also "Treating Maladaptive Behavior Using Functional Analysis," and "Autism Resources: Information for Families."
- Behavior therapists may be available in either a school or in the community.

Psychotropic Medications:
- If aggression, self-injury, irritability, or mood swings are severe, consider Risperidone or secondarily Abilify after reviewing “Psychotropic Medication Considerations for Children with Autism.”

Co-morbid Psychiatric Disorders:
- Conditions such as ADHD, anxiety or depression do occur in children with autism, but avoid attributing core autism spectrum symptoms (e.g., poor eye-contact, flat affect, social withdrawal, repetitive behavior, rigidity, or concrete thought process) to a psychiatric diagnosis without noting if there had been a change from baseline. Use evidenced-based therapies for psychiatric disorders to the extent they are developmentally appropriate. Consider psychotropic medications when appropriate for a condition, but first review “Psychotropic Medication Considerations for Children with Autism.”

A. A. Golombek, MD and Robert Hilt, MD
Treating Maladaptive Behavior for the Developmentally Disabled Using Functional Analysis

**Identify the behavior**
- **Character** (what they do)
- **Timing** (especially noting provoking and reinforcing factors)
- **Frequency** (times per day or per week)
- **Duration** (i.e. 30 minute behaviors are different than 30 second behaviors)

**Analyze and make hypotheses about the function of the behavior**
- **Communication.** This is the primary etiology to investigate if a child lacks communication skills. Maladaptive behavior may communicate *physical discomfort* like pain, constipation, reflux or a new illness. It may also communicate an *emotional discomfort* like boredom, anxiety, anger, frustration, sadness, or over-excitement.
- **Achieving a goal.** How does performing the behavior benefit the child, what does he/she gain? This might include escaping an undesired situation, avoiding a transition, acquiring attention, or getting access to desired things like toys or food.
- **No function.** If there is *no* function identifiable for the behavior, this suggests causes like seizures, medication side effects, sleep deprivation, and other medical or psychiatric disorders.

**Modify the environment by changing provoking and reinforcing factors**
- Enhance communication—consider using an alternative communication system, such as a picture-exchange communication system (PECS) for non-verbal children.
- Use simple, concrete sentences and questions with child. Remain calm.
- Increase structure—provide schedule of day’s events, use routines, anticipate transitions. Consider social stories to practice routines, especially to prepare for new situations. Teach the child how to ask for help and how to tell adults when they need a break.
- Modify demands—match the task to their IQ, developmental stage & language ability. Limit time for tasks, schedule fun activities after less preferred ones.
- Allow child access to a time-limited escape to a calm, quiet place if overwhelmed.
- Reinforce positive behavior with attention and praise, find out what child finds rewarding (special activity, food, favorite toy, a gold star, etc.)
- Avoid reinforcing maladaptive behavior with attention or other gains.
- Schedule special, non task-driven, time for child and parents together that is honored and not conditional on other behaviors.

**Consult with a behavioral specialist to facilitate process and support family**
- Behavior modification specialists can make tailored suggestions for the family’s situation.
- If behavior is at school, consult with the school psychologist for a behavioral intervention.

**If strategies are insufficient or behavior is severe, or places child or others at risk of harm, consider augmentation with medications**
- See Care Guide sections, “Psychotropic Medication Considerations in Children with Autism” and “Non-Specific Medications for Disruptive Behavior and Aggression”.

A. A. Golombek, MD and Robert Hilt, MD
Applied Behavioral Analysis (ABA) Tip Sheet

What is ABA?
ABA is a type of therapy that helps children improve communication and social skills as well as de-crease or eliminate a range of problematic behaviors. Applied Behavior Analysis focuses on understanding behavior as a function of an individual’s environment and then modifying behavior to achieve a range of goals. ABA uses the principles of learning to teach skills that improve behavior and communication related to core impairments associated with autism. ABA has the most empirical support of any treatment for autism spectrum disorder (ASD). It is also very time and labor intensive and very expensive.

What behaviors or skill deficits can be addressed with ABA?
ABA techniques have been shown to have efficacy for specific problem behaviors as well as academic tasks, adaptive living skills, communication, social skills, and vocational skills. In framing the need to parents, schools or an insurance company, consider both the need for skill acquisition and/or reducing problem behaviors as goals. Skills that can be improved include functional communication, social interaction, flexibility in play, frustration tolerance, self-care, affect regulation and relaxation strategies. Common behavioral targets include tantrums, physical aggression, property destruction, self-stimulation, pica, elopement/escape behaviors, and inappropriate social interactions/boundaries. Because most children with ASD tend to learn tasks in isolation, generalization beyond an ABA setting is an important goal.

How do I help my patient and families access ABA?
The route to receiving ABA therapy varies depending on the type of insurance coverage, but it generally begins with a referral to, and evaluation by, an approved provider. Which individual or disciplines have been “approved” for determining the appropriateness of ABA varies by insurance carrier. It can be a challenging process to get a prescription for ABA and locate a provider who does this work, however, coverage is beginning to improve.

What if my patient is covered by a Medicaid managed care plan (eg. Apple Health)?
Because of federal mandates, children with public insurance often have an easier time accessing ABA compared to children with private insurance. For children under age 20 diagnosed with ASD who are covered by Medicaid or one of the associated managed care plans, the Washington State Developmental Disability Council (DDC) recommends that parents or caregivers contact the Health Care Authority (aba@hca.wa.gov OR 1-800-562-3022) for assistance accessing ABA. The general process as outlined by the DDC involves a) a referral from a health care professional or caregiver for testing and comprehensive evaluation at a Center of Excellence (http://www.hca.wa.gov/medicaid/abatherapy/pages/index.aspx) b) the writing of an order for ABA services (usually in the form of a letter or embedded in encounter documentation) c) assessment by a qualified board certified behavior analyst (BCBA) and development of a treatment plan d) and then submission of plan for authorization by HCA. Re-authorization is typically required by BCBA at a 3-6 month interval.

What if my patient is covered by private insurance?
Washington Autism Alliance and Advocacy (http://www.washingtonautismadvocacy.org/updates/) has Resource Coordinators to assist families in accessing private health insurance benefits for their children. Public employees and military personnel (Tricare) should contact their plan or benefits manager for guidance on how to apply for ABA.

David Camenisch, MD MPH
Psychiatric Medication Considerations for Children with Autism

- Medications do not improve core autism features; i.e. there is currently no “autism medication.”
- Consider augmenting behavioral or counseling treatments with medications if there is moderate to severe distress and dysfunction in an area noted to be medication responsive.
- Use a single medication appropriate to a diagnosis or target symptom. Start low and increase slowly.
- Track the target symptom’s response to interventions.
- Be skeptical about the utility of medicines that “work” for only a couple of weeks before a dose increase seems to be required—it is not safe to increase medicine doses indefinitely beyond the normal dosage range.
- If an intervention isn’t reducing symptoms, taper and remove the medication, then re-evaluate. Be vigilant about stopping any medication that is not clearly helpful.
- A history of past benefit from a medication does not necessarily mean there is continued benefit from ongoing use. Periodic attempts to wean off a previously helpful medication (such as annually) will reveal if ongoing use of that medicine is desirable.
- Do not exceed maximum dose recommendations for typically developing children. Note children with autism typically experience more adverse effects than others do from psychotropic medications.

Some medications to consider include:

**Risperidone**: FDA approved for children 5-16 years of age with irritability, aggression, self-injury, and quick mood swings associated with autism. Use if behavioral therapy is yielding inadequate results on severe symptoms. Can have many adverse effects including weight gain, dystonia, sedation, neuroleptic malignant syndrome, tardive dyskinesia and both cholesterol and glucose elevations. Suggest start at 0.25-0.5mg/day, usual effective dosage is less than 2mg/day. Requires glucose, lipid panel, and AIMS monitoring (see page 57).

**Aripiprazole**: FDA approved for children aged 6 to 17 years for symptoms of aggression toward others, deliberate self injury, temper tantrums and quick mood swings associated with autism. Has same adverse effects and monitoring needs as risperidone, including probability of weight gain. As a newer agent, less autism research and clinical experience exists relative to risperidone. Effective in 2-15mg/day range of dosing. No generic formulation. Requires glucose, lipid panel, and AIMS monitoring (see page 57).

**Stimulants**: Consider if an ADHD comorbidity, though they may have less benefit on ADHD symptoms than children without autism. They have more adverse effects than children without autism, including more irritability, insomnia, and social withdrawal. Best studied of this group is methylphenidate. If used, start with 2.5mg/dose or 0.125mg/kg bid to tid.

**SSRI’s**: Consider if an anxiety or depression comorbidity. Are shown to not improve any of the core autism features. SSRI’s have increased rates of adverse effects including agitation, irritability, elation, and insomnia than for children without autism.

The diagnosis of bipolar disorder in children is a controversial topic even amongst child psychiatric specialists. This controversy makes it difficult for primary care providers to know what to do when they are wondering about bipolar disorder in their patient.

We would prefer that primary care providers would not have to struggle with this, and could refer all such patients to skilled mental health specialists to assist with diagnosis and treatment. The reality is that many primary care providers feel they do not have that option.

This guide on bipolar diagnosis and treatment aims to provide guidance to the primary care provider struggling on their own to sort out a diagnosis, or otherwise manage a bipolar disordered child in their practice.
Considering Bipolar Disorder?

Strongly consider other reasons for the symptoms such as:
- ADHD
- Conduct Disorder
- Oppositional Defiant Disorder
- Major Depression
- Early abuse or neglect in dysregulation syndromes
- “Difficult” temperament of child plus interpersonal conflicts
- Autism Spectrum Disorder, especially with oppositionality
- OCD, separation anxiety or other anxiety disorder
- Medical causes of mania (including fetal alcohol syndrome)

Safety check:
- Suicidality?
- Drug abuse?
- Current neglect/abuse?

Diagnosis:
- Does child have history of clear manic episode for >4 days?
- History of hospitalization for mania?
- History of psychosis or severe suicidality?
- Symptom of inappropriate euphoria/grandiosity?

Yes

Is this an “Unspecified,” or “Other Specified” Bipolar disorder?
These are the DSM5 labels for bipolar symptoms that cause impairment, but the duration or other criteria for Bipolar I or II are not met. This “soft” criteria bipolar diagnosis in children is controversial. Most irritable, moody, irrational, hyperactive kids when evaluated more fully are found NOT to have a bipolar disorder.

More likely Bipolar spectrum if:

Less likely Bipolar spectrum if:

Treatment:
1. Consider consultation with a mental health specialist, especially if safety concerns
2. Consider medical causes of manic symptoms like hyperthyroidism, neurological dysfunction
3. Psychosocial/behavioral intervention tailored to family, including:
   a. family psychoeducation
   b. child/family focused CBT
   c. enhancing school and community supports
   d. individual or family psychotherapy
   e. behavior management training
4. Medication trial, single agent preferred, choose among:
   a. atypical antipsychotic
   b. lithium
   c. lamotrigine (especially if bipolar depression)
   d. divalproex, carbamazepine also options, though have less evidence basis
5. Be cautious of prescribing antidepressants (manic switching risk)
6. Follow up frequently, perhaps weekly until stabilizing
7. Ensure adequate sleep hygiene—consider sleep medications if necessary

---

**Monitoring for all atypical antipsychotics:**

1. *Weight checks and fasting glucose/lipid panel roughly every 6 months.*
2. *If weight gain is severe, will need to change treatments.*
3. *AIMS exam at baseline and Q6 months due to risk of tardive dyskinesia that increases with duration of use.*
4. *Review neuroleptic malignant syndrome risk (i.e. severe allergic reaction) before starting medication.*
5. *Discuss dystonia risk, and explain the use of diphenhydramine if needed as antidote.*
## Bipolar Disorder Medications

### Other Medication Options

<table>
<thead>
<tr>
<th>Drug Name</th>
<th>Bipolar (+) RCT evidence in kids</th>
<th>FDA bipolar approved children?</th>

<tbody>
<tr>
<td>Lithium</td>
<td>Yes</td>
<td>Yes (over age 12)</td>
<td>Baseline EKG, BUN/creat, TSH, CBC. Lithium level after 5 days. Q3month Lithium level. Q6mo TSH,BUN/ creatinine</td>
<td>Sedating, weight gain, renal and thyroid toxicity. If dehydration can get acute toxicity. Reduces suicide risk though an overdose can be fatal</td>
</tr>
<tr>
<td>Valproate</td>
<td>No</td>
<td>No</td>
<td>CBC, LFT at baseline, in 3 month, then Q6month. VPA level checks needed</td>
<td>Weight gain, sedation, rare severe toxicity of liver, ↓platelets ↓WBC, risk of polycystic ovarian syndrome</td>
</tr>
<tr>
<td>Carbamazepine</td>
<td>No</td>
<td>No</td>
<td>CBC, LFT at baseline, then every 3-6 months. CBZ level checks needed</td>
<td>Aplasia and rash risk. Oxcarbazepine bipolar trial with kids had negative results</td>
</tr>
<tr>
<td>Lamotrigine</td>
<td>No</td>
<td>No</td>
<td>CBC, LFT at baseline, in 2-4 weeks, then Q6 month. Monitor for rash</td>
<td>Stevens-Johnson rash risk requires slow titration, adult studies support use for bipolar depression</td>
</tr>
</tbody>
</table>
Monitoring for all atypical antipsychotics: AIMS exam at baseline and ~Q6months due to risk of tardive dyskinesia. Warn of dystonia risk.

Weight checks, fasting glucose/lipid panel ~Q6months at minimum.
Bipolar Disorder Resources
Information for Families

There is no shortage of books written about childhood bipolar disorder. Despite this fact, quality research based and balanced information is hard to find. This reflects the fact that an intense professional debate is currently raging about how bipolar disorder in children is defined, with some authors using “bipolar, unspecified type” as a label for any very irritable child.

Families should start their learning about bipolar disorder with the following websites that provide high quality information and support.

Books families may find helpful:

An Unquiet Mind (1995), by Kay Redfield Jamison, MD (a memoir by a bipolar disorder researcher who had the illness herself - can be helpful for understanding the nature of Bipolar I illness)

Bipolar Disorder for Dummies (2005), by Candida Fink, MD and Joe Craynak (don't be put off by the name of the book, it is balanced and easy to read)

The Bipolar Workbook: Tools for controlling your mood swings (2006), by Monica Ramirez Basco (contains some practical advice, based on CBT principles)

Your Child Does Not Have Bipolar Disorder (2011) by Stuart Kaplan (describes when a bipolar label would not be appropriate, and how we know how to help irritable, angry, explosive children)

Websites families may find helpful:

American Academy of Child and Adolescent Psychiatry, Practice Parameter on Bipolar Disorder. This contains a very detailed review of treatments. www.aacap.org/AACAP/Resources_for_Primary_Care/Practice_Parameters_and_Resource_Centers/Practice_Parameters.aspx

National Alliance for the Mentally Ill www.nami.org

The Balanced Mind Foundation www.thebalancedmind.org

Parents Med Guide, contains bipolar disorder medication information from American Psychiatric Association and American Academy of Child and Adolescent Psychiatry

This resource page is now available in Spanish at www.palforkids.org
Depression
**Depressive Symptoms?**

Unexplained Somatic Complaints?

Safety screen: Neglect/Abuse?
Medical condition (i.e., anemia, thyroid problem?)
Thoughts of hurting oneself?
if yes, are there plans and means available?

Think about comorbidity: Anxiety, ODD, Conduct Disorder, ADHD, Dysthymia, Substance abuse

**Diagnosis:**

DSM-5 Diagnostic Criteria
Rating Scale: SMFQ or PHQ-9 (others available for a fee)
Label as “Depression, NOS” if significant symptoms but not clear if Major Depression

Can problem be managed in primary care?

**Mild Problem**

(noticeable, but basically functioning OK)

Educate patient and family
Support increased peer interactions
Behavior activation, exercise
Encourage good sleep hygiene
Reduce stressors, if possible
Remove any guns from home
Offer parent/child further reading resources

Follow up appointment in 2-4 weeks to check if situation is getting worse
Repeating rating scales helps comparisons
Those not improving on their own are referral candidates for counseling

**Moderate/Severe Problem**

(significant impairment in one setting, or moderate impairment in multiple settings)

Recommend individual psychotherapy
CBT and IPT are preferred, where available
Psychoeducation, coping skills, and problem solving focus are all helpful therapy strategies
Educate patient and family (as per mild problem list on left)
Consider family therapy referral

Consider starting SSRI, especially if severe
Fluoxetine is the first line choice
Citalopram/Sertraline second line
Third line agents are other SSRIs, buproprion, mirtazepine
Wait four weeks between dose increases to see changes
Check for side effects every 1-2 weeks in first month of use to ensure no new irritability or suicidality (phone or in person)
Stop SSRI if get agitation, anxiety or suicidal thoughts
Consult MH specialist if monotherapy is not helping
Monitor progress with repeat use of rating scale

Referral

**Judgment Call**

YES

NO

SHORT MOOD AND FEELINGS QUESTIONNAIRE

This form is about how you might have been feeling or acting recently.

For each question, please check how much you have felt or acted this way in the past two weeks.

If a sentence was true about you most of the time, check TRUE.
If it was only sometimes true, check SOMETIMES.
If a sentence was not true about you, check NOT TRUE.

1. I felt miserable or unhappy
2. I didn’t enjoy anything at all
3. I felt so tired I just sat around and did nothing
4. I was very restless
5. I felt I was no good any more
6. I cried a lot
7. I found it hard to think properly or concentrate
8. I hated myself
9. I was a bad person
10. I felt lonely
11. I thought nobody really loved me
12. I thought I could never be as good as other kids
13. I did everything wrong

Scoring the SMFQ
(Short Mood and Feelings Questionnaire)

Note: the SMFQ has been validated for use in children age 6 years and up.

The SMFQ should not be used to make a definitive diagnosis of depression. It has usefulness as a screening tool for situations where depression is suspected, and as an aide toward following a child’s symptom severity and treatment response over time.

**Scoring:**

Assign a numerical value to each answer as follows:
Not true = 0
Sometimes = 1
True = 2

Add up the assigned values for all 13 questions. Record the total score.

A total score on the child version of the SMFQ of 8 or more is considered significant.

Sensitivity/specificity statistics of the parent version is not reported in the literature. If your patient does not complete the child version of SMFQ, repeated administration of the parent version over time should still be useful for symptom tracking.
# PATIENT HEALTH QUESTIONNAIRE (PHQ-9)

**NAME:** ________________________________  **DATE:** ________________

Over the last 2 weeks, how often have you been bothered by any of the following problems? *(use "✓" to indicate your answer)*

<table>
<thead>
<tr>

Scoring the PHQ-9
(Patient Health Questionnaire)

Note: this scale has not been evaluated for use with pre-pubertal children. A number of studies have used this scale for adolescent patients.

The PHQ-9 should not be used to make a definitive diagnosis of depression. It has usefulness as a screening tool for situations where depression is suspected, and as an aide toward following a child’s symptom severity and treatment response over time.

Any positive response to question 9 should be followed up with questions about the child’s current safety. Any immediate plans for suicide require an emergent response.

Question 10 should be noted as at least “somewhat difficult” to be consistent with a diagnosis of depression. A depression diagnosis requires a functional impairment to be present.

Add up the total number from items 1-9

Estimated depression severity:

<table>
<thead>
<tr>
<th>Score</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-4</td>
<td>None</td>
</tr>
<tr>
<td>5-9</td>
<td>Minimal symptoms</td>

<td>37.5 mg/day (225mg max)</td>
<td>37.5 to 75mg **</td>
<td>No (May have higher SI risk than others for children)</td>
<td>No</td>
<td>Only recommended for older adolescents. Withdrawal symptoms can be severe.</td>
</tr>
</tbody>
</table>

*Starting doses in children less than 13 may need to be lowered using liquid forms*  
*Successful medication trials should continue for 6 to 12 months*  
*Recommend decrease maximum dosage by around 1/3 for pre-pubertal children*  
*Recommend using the lower dose increase increments for younger children.*
Crisis Prevention Plan Aide
A parent’s guide to creating a crisis prevention plan

Crisis Prevention Plans (CPP) are intended to help children/adolescents and their caregivers prevent minor problems from escalating into crisis events. CPPs provide an opportunity for the child/adolescent and the caregiver to logically think through situations by identifying the cause of distress, understanding and discussing options for minimizing difficult situations, and encouraging coping skills to help decrease the distress. Key components of a CPP include understanding triggers, identifying warning signs, and helping to facilitate interactions that will decrease the possibility of further difficulties. A thoughtful and carefully constructed CPP can help families make choices and take actions to diffuse difficult situations.

Steps for creating your own Crisis Prevention Plan:

- **Discuss triggers** – Triggers are things that cause distress for the child/adolescent. Common triggers include peer conflict, homework, chores, feeling sad or angry, and being told “no” or being unable to get their way. The child/adolescent and caregiver should be honest and explicit about the triggers for what is currently causing them the most difficulty.

- **Identify early warning signs** – Warning signs are physical clues the child/adolescent does (sometimes without their knowledge) that show others that they are upset or distressed. Common warning signs include blushing/flushed face, clenching fists, pacing, yelling, or withdrawing/becoming quiet.

- **List interventions the caregiver can do** to help the child/adolescent calm down – Discuss what the child/adolescent would want, and how the caregiver could provide that for them. Examples include giving the child/adolescent space to calm down, reminding them to use a coping skill, talking with them, or offering a hug.

- **List things the child/adolescent can do** to help calm themselves – This typically includes coping skills such as listening to music, talking a walk, doing deep breathing exercises, taking time to themselves (include a mention of how long to let the child/adolescent “cool off” before being expected to re-engage with the family), writing, drawing/coloring, or other relaxation techniques.

- **Identify other supports** if the above interventions aren’t helpful or are unavailable – for instance, list three people the child/adolescent can contact, beside the caregiver, when distressed. Examples include peers who would have a positive influence, relatives, older siblings, therapists, or teachers/coaches. The child/adolescent and caregiver should agree who are a good resource. Also identify and list the crisis line where you live. A teen hotline such as Teen Link (1-866-833-6546 or http://866teenlink.org) is also helpful.

Christina Clark, MD
Crisis Prevention Plan

**My triggers are:**
1. 
2. 
3. 
4. 
5. 

**My early warning signs are:**
1. 
2. 
3. 
4. 
5. 

**When my parents/caregivers notice my early warning signs, they can:**
1. 
2. 
3. 
4. 
5. 

**Things I can do when I notice my early warning signs:**
1. 
2. 
3. 
4. 
5. 

**If I am unable to help myself I can call:**
1. 
2. 
3. 
4. 
5. 

- Your County Crisis Line Phone Number: ______________________
  (you can look it up here: https://www.dshs.wa.gov/bhsia/division-behavioral-health-and-recovery/regional-support-networks-rsns-services-information)
- Teen Link Hotline: 1-866-833-6546 or http://866teenlink.org
- The National Suicide Hotline: 1-800-784-2433

This Crisis Prevention Plan was created to give your family strategies you can use in your home to help calm your child during an escalation before they reach a crisis point. We do not advise using restraint, such as holding your child down, because you or your child could get hurt. Please call 911 if you or your child is in imminent danger.
General Home Safety Recommendations
After a Child Crisis Event

The following safety tips may help to keep things safe right now after an escalated crisis event, and help to reduce further escalations/crises:

1. In the home environment, maintain a “low-key” atmosphere while maintaining regular routines
2. Follow your typical house rules, but pick your battles appropriately, for example:
   - immediately intervene with aggressive or dangerous behaviors
   - if your child is just using oppositional words, it may be wise to ignore those behaviors
3. Provide appropriate supervision until the child’s crisis is resolved
4. Make a crisis prevention plan by identifying likely triggers for a crisis (such as an argument), and plan with your child what the preferred actions would be for the next time the triggers occur (such as calling a friend, engaging in a distracting activity or going to a personal space)
5. Encourage your child to attend school, unless otherwise directed by your provider
6. Make sure that you and your child attend the next scheduled appointment with their provider
7. Administer medications as directed by your child’s medical or psychiatric provider
8. Go into each day/evening with a plan for how time will be spent—this should help prevent boredom and arguments in the moment
9. Secure and lock up all medications and objects your child could use to hurt him/herself and/or use to attempt suicide. When locking up items, ensure your child does not have knowledge of their location, the location of the key, or the combination to any padlock used to secure them. This includes:
   - Sharp objects like knives and razors
   - Materials that can be used for strangulation attempts, such as belts, cords, ropes and sheets
   - Firearms and ammunition (locked and kept in separate/different locations from each other)
   - All medications of all family members, including all over the counter medicines. If your child takes medication of any type, you should administer it for the time being (unless instructed to stop it by your care provider)

In the event of another crisis, please do the following:
- If you believe that you, your child, or another person is no longer safe as a result of your child’s behavior, call 911 to have your child transported to the emergency department closest to your home
- Consider calling your local county crisis hotline, which are listed at https://www.dshs.wa.gov/bhsia/division-behavioral-health-and-recovery/regional-support-networks-rsns-services-information
- Consider calling the national suicide hotline: 1-800-784-2433

Eating Disorder
Possible Eating Disorder?

Consider other causes of symptoms:
- Malignancy
- GI disorder like Crohn’s disease
- Endocrine disorder like diabetes mellitus
- Depression
- Obsessive compulsive disorder
- Chronic infection or disease
- Superior mesenteric artery syndrome
- History of sexual abuse

Safety check: Suicidality?
Medically unstable? (hospital criteria below)

Diagnosis:
- EAT-26 rating scale can be helpful for screening
- DSM-5 criteria for anorexia nervosa and bulimia nervosa
- Record highest stable weight and current weight
- Body image concerns: “Do you like your body?”
- Inquire about all restrictive and purging habits
  (including exercise, laxative, vomiting, caffeine/nicotine or other substance abuse)

Management:
1. Initial lab: CBC, electrolytes, LFT, UA, TSH, baseline EKG
2. Establish plan for frequent weight check, HR, BP, temp. Follow-up weekly if low weight.
3. Referral to a nutritionist, preferably one with eating disorder experience
4. Referral to therapist, eating disorder experience preferred
   - Family based approach best supported if <16 years old or illness < 3 year
   - Group therapy with anorexic children is not recommended.
4. Medications:
   - consider SSRI like fluoxetine for binge/purge of bulimia, or if anorexic
     with weight > 85%ile to decrease rate of relapse
     (not good evidence for use of other medications)
5. Consider hospital admission if:
   - HR < 40
   - Weight < 75 percentile of ideal
   - Severe dehydration
   - Acute food refusal
   - Suicidality
   - EKG changes
     - Intractable vomiting
     - Orthostatic hypotension
     - Precipitous weight loss
     - Severe electrolyte imbalance
     - Hypothermia

Primary References:
Eating Attitudes Test© (EAT-26)

Instructions: This is a screening measure to help you determine whether you might have an eating disorder that needs professional attention. This screening measure is not designed to make a diagnosis of an eating disorder or take the place of a professional consultation. Please fill out the below form as accurately, honestly and completely as possible. There are no right or wrong answers. All of your responses are confidential.

### Part A: Complete the following questions:

1) Birth Date  
   - Month: [ ]  
   - Day: [ ]  
   - Year: [ ]
2) Gender: [ ] Male [ ] Female
3) Height  
   - Feet: [ ]  
   - Inches: [ ]
4) Current Weight (lbs.): [ ]
5) Highest Weight (excluding pregnancy): [ ]
6) Lowest Adult Weight: [ ]  
7) Ideal Weight: [ ]

### Part B: Please check a response for each of the following statements:

<table>
<thead>
<tr>
<th>Statement</th>
<th>Always</th>
<th>Usually</th>

<th>Once a month or less</th>
<th>2-3 times a month</th>
<th>Once a week</th>
<th>2-6 times a week</th>
<th>Once a day or more</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Gone on eating binges where you feel that you may not be able to stop?</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>B. Ever made yourself sick (vomited) to control your weight or shape?</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>C. Ever used laxatives, diet pills or diuretics (water pills) to control your weight or shape?</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>D. Exercised more than 60 minutes a day to lose or to control your weight?</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>E. Lost 20 pounds or more in the past 6 months</td>
<td>☐ Yes</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
</tr>
</tbody>
</table>

- Defined as eating much more than most people would under the same circumstances and feeling that eating is out of control.

Scoring the Eating Attitudes Test © (EAT-26)

The Eating Attitudes Test (EAT-26) has been found to be highly reliable and valid (Garner, Olmsted, Bohr, & Garfinkel, 1982; Lee et al., 2002; Mintz & O’Halloran, 2000). However the EAT-26 alone does not yield a specific diagnosis of an eating disorder.

Scores greater than 20 indicate a need for further investigation by a qualified professional.

Low scores (below 20) can still be consistent with serious eating problems, as denial of symptoms can be a problem with eating disorders.

Results should be interpreted along with weight history, current BMI (body mass index), and percentage of Ideal Body Weight. Positive responses to the eating disorder behavior questions (questions A through E) may indicate a need for referral in their own right.

EAT-26 SCORE

Score the 26 items of the EAT-26 according to the following scoring system. Add the scores for all items.

Disruptive Behavior and Aggression
Disruptive Behavior or Aggression?
Suspect Oppositional Defiant Disorder or Conduct Disorder?

Safety check: Neglect/Abuse? Drug abuse? Specific plan to hurt someone?

Think about comorbidity: ADHD Major Depression (irritable mood type) Bipolar disorder Anxiety disorder

Diagnosis:
See DSM-5 criteria
ODD: Pattern of angry/irritable, argumentative/defiant and vindictive behavior of > 6 months
CD: Pattern of behavior violating rights of others/societal norms > 1 year
Rating scale screen: Vanderbilt ADHD scale

Can problem be managed in primary care?
NO → Referral to Mental Health Specialist
YES → Child Focused Treatments

Individual psychotherapy focused on problem solving skills, and helping identify and institute tangible rewards for desired behavior.
Avoid group therapy as may reinforce negative behaviors)
Parent involvement/training is essential to get positive results.
Encourage "special time" interactions between parent and child

If ADHD present, strongly consider use of stimulant medication

Although not preferred, if very severe symptoms or if unable to make progress with child/parent counseling after a reasonable counseling effort over a few months, consider medication as symptom focused treatment trial. Note planned, purposeful aggression is not helped by medication.

If use a medicine, identify child specific treatment goals which can be monitored to measure treatment effects, like the frequency/severity of violent incidents. Stop any failed medication trials before beginning any new prescription (avoiding polypharmacy).

Non-specific medication options for maladaptive impulsive aggression include divalproex sodium, lithium, atypical antipsychotics, stimulants, and α-2 agonists. The α-2 agonists are usually preferred as a first trial due to overall lower side effect risks. Antipsychotics like risperidone have greater cumulative medical risks, but are more likely to yield a decrease in aggression.

Parent Focused Treatments

Young Children: strongly recommend a therapist to teach behavior management skills. Many models for this like Parent Child Interaction Training (PCIT), the Barkley method and 1-2-3 Magic.
Adolescents: recommend parent/family therapy or training such as functional family therapy (FFT) or Multisystemic Therapy (MST).
Parent should create some regular positive time with their child (like "special time") as this helps other discipline to be more effective.
Encourage parent to utilize our bibliotherapy/video references on learning behavior management techniques

If acute danger, have duty to protect or report risks. Consider consultation

Primary References:
Non-Specific Medications for Disruptive Behavior and Aggression

- If used, choosing a single medication is strongly recommended over polypharmacy
- Establish a specific target to treat, and measure the response over time (such as anger explosion frequency, duration)
- Aggression is not a diagnosis—continue to look for and treat what may be the cause, usually prescribing psychotherapy and behavior management training as the treatments of choice

*Monitoring for all atypical antipsychotics: AIMS exam at baseline and Q6months due to risk of tardive dyskinesia. Warn of dystonia & NMS risks. Weight checks, fasting glucose/lipid panel Q6months at minimum.

**Pappadopulos E et al. (2006) and lit. review

None of the medications on this page are FDA approved for aggression treatment, with the exception of risperidone and aripiprazole which are approved for irritability/aggression treatment in autism.
**ABNORMAL INVOLUNTARY MOVEMENT SCALE (AIMS)**

**INSTRUCTIONS:** COMPLETE EXAMINATION PROCEDURE BEFORE MAKING RATINGS. MOVEMENT RATINGS: RATE HIGHEST SEVERITY OBSERVED. RATE MOVEMENTS THAT OCCUR UPON ACTIVATION ONE LESS THAN THOSE OBSERVED SPONTANEOUSLY.

**EXAMINATION PROCEDURE**

EITHER BEFORE OR AFTER COMPLETING THE EXAMINATION PROCEDURE OBSERVE THE PATIENT UNOBTRUSIVELY AT REST (E.G., IN WAITING ROOM). THE CHAIR TO BE USED IN THIS EXAMINATION SHOULD BE A HARD, FIRM ONE WITHOUT ARMS.

1. ASK PATIENT WHETHER THERE IS ANYTHING IN HIS/HER MOUTH (I.E., GUМ, CANDY, ETC) AND IF THERE IS, TO REMOVE IT.
2. ASK PATIENT ABOUT THE CURRENT CONDITION OF HIS/HER TEETH. ASK PATIENT IF HE/SHE WEARS DENTURES. DO TEETH/DENTURES BOTHER PATIENT NOW?
3. ASK PATIENT WHETHER HE/SHE NOTICES ANY MOVEMENTS IN MOUTH, FACE, HANDS, OR FEET. IF YES, ASK TO DESCRIBE AND TO WHAT EXTENT THEY CURRENTLY BOTHER PATIENT OR INTERFERE WITH HISHER ACTIVITIES.
4. HAVE PATIENT SIT IN CHAIR WITH HANDS ON KNEE LEGS SLIGHTLY APRAT AND FEET FLAT ON FLOOR. (LOOK AT ENTIRE BODY FOR MOVEMENTS WHILE IN THIS POSITION)
5. ASK PATIENT TO SIT WITH HANDS HANGING UNSUPPORTED. IF MALE, BETWEEN LEGS, IF FEMALE AND WEARING A DRESS, HANGING OVER KNEES (OBSERVE HANDS AND OTHER BODY AREAS.)
6. ASK PATIENT TO OPEN MOUTH. (OBSERVE TONGUE AT REST WITHIN MOUTH.) DO THIS TWICE.

**FACIAL AND ORAL MOVEMENTS:**

1. MUSCLES OF FACIAL EXPRESSION E.G., MOVEMENTS OP FOREHEAD, EYEBROWS, PERIORBITAL AREA, CHEEKS, INCLUDE FROWNING, BLINKING, SMILING, GRIMACING 0 1 2 3 4
2. LIPS AND PERIORAL AREA E.G., PUCKERING POUTING, SMACKING 0 1 2 3 4
3. JAW E.G., BITING, CLENCHING, CHEWING, MOUTH OPENING, LATERAL MOVEMENT 0 1 2 3 4
4. TONGUE RATE ONLY INCREASE IN MOVEMENT BOTH IN AND OUT OF MOUTH; NOT INABILITY TO SUSTAIN MOVEMENT 0 1 2 3 4

**EXTREMITIES MOVEMENTS**

6. LOWER (LEGS, KNEES, ANKLES, TOES) E.G., LATERAL KNEE MOVEMENT, FOOT TAPPING, HEEL DROPPING, FOOT SQUIRMING, INVERSION AND EVERSION OF FOOT 0 1 2 3 4

**TRUNK MOVEMENTS:**

7. NECK, SHOULDERS, HIPS E.G., ROCKING, TWISTING, SQUIRMING PELVIC GYRATIONS 0 1 2 3 4

**GLOBAL JUDGMENTS:**

8. SEVERITY OF ABNORMAL ACTION 0 1 2 3 4
9. INCAPACITATION DUE TO ABNORMAL MOVEMENTS 0 1 2 3 4
10. PATIENT'S AWARENESS OF ABNORMAL MOVEMENTS 0 1 2 3 4

**DENTAL STATUS:**

11. CURRENT PROBLEMS 0 1 2 3 4
12. DOES PATIENT USUALLY WEAR DENTURES? 0 1 2 3 4

*Monitoring for all atypical antipsychotics: AIMS exam at baseline and ~Q6months due to risk of tardive dyskinesia. Warn of dystonia risk.*

*Weight checks, fasting glucose/lipid panel ~Q6months at minimum.*
“Time out” means taking a specific time away from attention, interesting activities, rewards or other reinforcement. It usually means placing the child in a dull, boring place immediately following an undesired behavior, and having them remain there for a specific amount of time. Time out can also involve a temporary loss of parental attention or interaction in situations where the physical space is limited (like no talking for 5 minutes while riding in a car).

It is often said that the length of time out should be one minute for each year of age, but adjustments need to be made based on developmental level—for instance a developmentally delayed child should have their time out times significantly reduced.

Time outs are simple in concept, but can be hard to implement. Here are some tips for greater success:

- **Set limits that are consistent**—if a given child behavior requires a time out one day it should always get that response. Inconsistency leads to more testing of the limits.

- **Focus on changing only one or two types of misbehavior at a time**. For instance if hitting a sibling is the main concern, focus your efforts on consistent time outs for that behavior and try to let other things slide for a while until you have results.

- **When you announce the time out, do not continue to engage verbally with your child**. This is very important—children that continue to verbally engage with you, bargain, plead, and yell back and forth with you will not receive the benefit from a time out because they are in essence receiving MORE attention from you during a time out rather than less. You can't control what their mouth does, but you can control your own. Remain calm, and refuse to take the bait.

- **Time outs should occur immediately after misbehavior**. A time out many minutes later sends a confused message. Delaying a time out by lecturing the child before the time out also hurts the process. The action of being quietly brought to a time out location and having no verbal interaction from you speaks far more loudly than any words can.

- **If giving a warning before use of time out, make it count**. For instance saying “do it one more time and you will get a time out” needs to be followed up by actually initiating the time out if they do “it” one more time.

- **Remember that kids enjoy making a splash**. Like throwing rocks in the water, triggering a parent to lose their cool can be entertaining or satisfying for a child. Keeping your cool when setting limits avoids inadvertently reinforcing their behavior to occur again.

- **You determine when the time out is over, not the child**. Setting a timer can make this seem less arbitrary to the child. Don’t be punitive with your child immediately after time out (e.g., lecturing, forcing a child’s apology). Simply “resume business as usual” or congratulate them on regaining personal control. *Then actively look for the next positive behavior to praise.*

Robert Hilt, MD
Special Time
Also known as “Child Directed Play”

A strength based approach to overall child behavior problems.

Goal of this is to establish regular times when parent and child have a positive experience in each other’s presence, supporting family self confidence, pleasure and hope. Regular special time together is like money in the bank that lessens times of crisis and re-establishes motivation for positive behaviors. Without regular positive parent/child interactions, corrective discipline is far less effective. For instance, families often find that time-outs work better after initiating special time.

How to do special time:

- Important to be done regularly, every day is optimal, but two or three times a week consistently is OK. Siblings should receive equal opportunity.
- Parent picks time of day.
- Label it “special time.”
- Pick a time short enough that it can be done reliably as scheduled, usually 15-30 minutes.
- Do it no matter how good or bad the day was.
- One on one without interruption.
- Child picks the together activity, which needs to be something the parent does not actively dislike doing and which does not involve spending money or completing any task or chore.
  - Examples might include playing together with child’s toys, or drawing pictures together.
- End on time: may use a timer to help. Remind child when the next special time will be. You may choose to play with the child more after taking a break from each other.
- If the child refuses at first, tell the child that you will just sit with him/her for that time, and/or that you will continue to invite the child to participate when next special time is scheduled.
- Parents also need to have some special time for him/herself. Parents who feel nurtured themselves find this is easier to do with their child.

Treating Disruptive Behavior and Aggression Using Functional Analysis

**Identify the behavior**
- **Character** (what they do)
- **Timing** (especially noting provoking and reinforcing factors)
- **Frequency** (times per day or per week)
- **Duration** (i.e. 30 minute behaviors are different than 30 second behaviors)

**Analyze and make hypotheses about the function of the behavior**
- **Communication.** This is the primary etiology to investigate for young children or if a child lacks communication skills. Maladaptive behavior may communicate physical discomfort like pain, GI distress or illness. It may also communicate emotional discomfort like boredom, anxiety, anger, frustration, sadness, or over-excitement.
- **Achieving a goal.** How does performing the behavior benefit the child, what does he/she gain? This might include escaping an undesired situation, avoiding a transition, acquiring attention, or getting access to desired things like toys or food.
- **No function.** If there is no function identifiable for the behavior, this suggests causes like seizures, medication side effects, sleep deprivation, and other medical or psychiatric disorders.

**Modify the environment by changing provoking and reinforcing factors.**
- Enhance communication—could try naming the thoughts or feelings that you believe the child may be having, like “I see that you want to eat right now.”
- Use simple, concrete sentences and questions with child.
- Remain calm since your emotional reaction may reinforce an undesired behavior.
- Increase structure—provide schedule of day’s events, use routines, anticipate transitions. Describe an upcoming routine to prepare for new situations. Teach child how to ask for help and how to tell adults when they need a break.
- Modify demands—match the task to their developmental stage & language ability. Limit time for tasks, schedule fun activities after less preferred ones.
- Allow child access to a time-limited escape to a calm, quiet place if overwhelmed.
- Reinforce positive behavior with attention and praise, find out what child finds rewarding (special activity, food, favorite toy, a gold star, etc.)
- Avoid reinforcing maladaptive behavior with attention or other gains.
- Schedule special, non task-driven, time for child and parents together that is honored and not conditional on other behaviors.

**Consult with a behavioral specialist to facilitate process and support family.**
- Behavior modification specialists can make tailored suggestions for the family’s situation.
- If behavior is at school, consult with the school psychologist for a behavioral intervention.

**If strategies are insufficient or behavior is severe, or places child or others at risk of harm, consider augmentation with medications.**
- See Care Guide section, “Non-Specific Medications for Disruptive Behavior and Aggression”.

A. A. Golombek, MD and Robert Hilt, MD
Bullying: Advice for the Primary Care Clinician

Bullying is aggressive behavior intended to hurt another person, often to gain power. It can be physical, verbal, social, in-person or in cyberspace. Strategies to address this common problem include:

**Screening** for bullying, especially when there is any acute change in mood, behavior, sleep, or somatic symptoms, or any change in social or academic functioning.

1) With **patients**, screening questions include, “Sometimes I hear about kids getting picked on... Have you been bullied or bullied others? How often? Have you seen bullying? How did you respond? Have you sent or received things electronically that may be bullying?”

2) With **parents**, screening questions include, “Sometimes bullying can really affect kids’ health and functioning... Have you seen your child being bullied by other kids? Have you heard about any bullying involving your child? Has your child talked about witnessing bullying at school?”

**Educating child** and family that bullying is not okay and should be addressed. Create a plan:

With a bullying **victim**, immediate action steps to recommend include:
- Walking away and tell a trusted adult who can be accessed quickly.
- Consider confronting a bully (elevate posture, eye contact, “bullying is not okay”).
- Changing the topic. Using humor.
- Accessing peers for support and ideas.

For a bullying **bystander**, action steps to recommend include:
- Asking adults to help during or even after the event.
- Stepping in to change the situation, label the bullying, using humor, suggesting a compromise.

**Working directly with the bully:**

1) Inquire about the motivation for bullying. Why is the bully trying to be in control? Talk about how to both lead and how to respond to feeling left out.

2) Bullies may be experiencing trauma in their own lives. Screen for abuse.

3) Discuss what makes a good friend and attempt to build empathy for the victim. Try to engender positive feelings towards making others feel good.

4) Review the potential negative consequences of bullying (friends avoiding, bigger peers may challenge, school policies).

**Engage parents, school and other care providers** about the bullying:

Parents and school staff should review the use of non-physical and non-shaming behavior management techniques, and set clear expectations for empathic behaviors. Children can be taught by counselors and teachers to use problem solving, emotion regulation, and anger management coping skills and how to make plans for alternative actions. Adults should model treating others with kindness and respect. Adults should monitor their child’s social media use. Parents can encourage participation in pro-social activities to build peer networks, enhance social skills, and gain confidence.

Parents and school officials can **learn more** about how to stop bullying at [www.stopbullying.gov](http://www.stopbullying.gov)

Sleep Hygiene for Children

- Keep consistent bedtimes and wake times every day of the week. Late weekend nights or sleeping-in can throw off a sleep schedule for days.
- Avoid spending lots of non-sleep time in bed—spending hours lying on a bed doing other activities before bedtime keeps our brains from associating the bed with sleep time.
- Child’s bedroom should be cool, quiet and comfortable. Children who stare at clocks should have their clocks turned away from them.
- Bedtime should follow a predictable sequence of events, such as brushing teeth and reading a story.
- Avoid high stimulation activities just before bed, such as watching television, playing videogames, communication with friends, or exercise. Do not do these things during a nighttime awakening either. It is best not to have videogames, televisions, computers or phones in the child’s bedroom.
- Having physical exercise as a part of the day often helps with sleep time many hours later.
- Relaxation techniques such as performing deep, slow abdominal breaths or imagining positive scenes like being on a beach can help a child relax.
- Avoid caffeine (sodas, chocolate, tea, coffee) in the afternoons/evenings. Even if caffeine doesn’t prevent falling asleep it can still lead to shallow sleep or frequent awakenings.
- If child is awake in bed tossing and turning, it is better for them to get out of bed to do a low stimulation activity, (i.e. reading) then return to bed later. This keeps the bed from becoming associated with sleeplessness. If still awake after 20-30 minutes, spend another 20 minutes out of bed before lying down again.
- Worry time should not be at bedtime. Children with this problem can try having a “worry time” scheduled earlier when they are encouraged to think about and discuss their worries with a parent.
- Children should be put to bed drowsy, but still awake. Letting them fall asleep other places forms habits that are difficult to break.
- Security objects at bedtime are often helpful for children who need a transition to feel safe and secure when their parent is not present. Try to include a doll, toy or blanket when you cuddle or comfort your child, which may help them adopt the object.
- When checking on a child at night, checks should be “brief and boring.” The purpose is to reassure the child you are present and that they are okay.
- If your child is never drowsy at the planned bedtime, you can try a temporary delay of bedtime by 30 minute increments until the child appears sleepy, so that they experience falling asleep more quickly once they get into bed. The bedtime should then be gradually advanced earlier until the desired bed time is reached.
- Keep a sleep diary to keep track of naps, sleep times and activities to find patterns and target problem areas when things are not working.
